Here's an updated section you can insert into the **Strategic and Implementation White Paper** on **Agent Factory Implementation with Salesforce Agentforce**. It fits naturally after Section 2 (Strategic Business Value) or as a new **Section 3: Agentforce Maturity Model**, with subsequent sections renumbered accordingly.

3. Salesforce Agentic Maturity Model

To guide organizations from initial experimentation to enterprise-scale agentic transformation, Salesforce introduced the **Agentic Maturity Model** in 2025. This framework provides a clear, progressive roadmap for adopting and scaling AI agents with Agentforce. It helps CIOs, architects, and business leaders assess their current state, prioritize investments, and measure progress toward becoming a true **Agentic Enterprise**—one where autonomous digital labor handles complex, cross-functional work reliably and at scale.

The model outlines **four primary levels of maturity** (with Level 0 representing the pre-agentic baseline of traditional automation). Progression is not strictly linear—organizations can advance in specific domains while building foundational capabilities across the board—but it emphasizes starting with high-value, contained use cases before tackling complexity.

Level 0: Fixed Rules and Repetitive Tasks (Chatbots & Co-pilots)

- **Description**: Rule-based systems and basic copilots that follow predefined scripts or simple flows. These handle repetitive tasks with no true reasoning or adaptability.
- **Capabilities**: Static responses, basic intent matching, limited or no access to real-time data.
- **Agentforce Relevance**: This is the starting point many organizations already occupy with legacy chatbots or Einstein Bots. Agentforce can quickly augment or replace these with more intelligent alternatives.
- **Business Value**: Low-to-moderate productivity gains; primarily augments humans without replacing labor.
- **Typical Use Cases**: FAQ handling, simple form filling, basic recommendations.

Level 1: Information Retrieval Agents

- **Description**: Agents that retrieve information from Customer 360 / Data Cloud, provide grounded answers, and make recommendations. They assist humans conversationally but do not execute actions independently.
- **Key Agentforce Features**: Topics with instructions, Knowledge grounding (RAG), Atlas Reasoning Engine for intent classification, citations for trust.
- **Business Value**: Improves response accuracy and speed; reduces time spent searching systems. Early ROI through higher customer/employee satisfaction.
- **Typical Use Cases**: Customer query resolution (e.g., “What is the status of my order?”), knowledge lookup, personalized recommendations.

Level 2: Simple Orchestration, Single Domain

- **Description**: Agents that not only retrieve information but also execute simple actions within one business domain. They orchestrate low-complexity workflows using predefined tools.
- **Key Agentforce Features**: Actions (Flows, Apex, Prompt Templates, MuleSoft APIs), basic Agentforce Script for deterministic logic, single primary agent with limited subagents.
- **Business Value**: Automates routine tasks, reduces manual handoffs, and delivers measurable efficiency (e.g., faster case resolution or lead qualification).
- **Typical Use Cases**: Booking a simple appointment, updating a record, processing a basic return within Service or Sales.

Level 3: Complex Orchestration, Multiple Domains

- **Description**: Agents handle end-to-end processes that span multiple domains or systems. They manage greater complexity, conditional logic, and cross-functional workflows while maintaining guardrails.
- **Key Agentforce Features**: Advanced multi-domain actions, deeper integration with Data 360, enhanced Agentforce Script for session state and branching logic, hybrid reasoning (LLM + deterministic controls).

- **Business Value**: Significant productivity leaps; agents resolve more complex issues autonomously, freeing humans for strategic work and improving process velocity.
- **Typical Use Cases**: Quote-to-cash processes, multi-step order management involving Service + Sales + Finance, proactive issue resolution across channels.

Level 4: Multi-Agent Orchestration (Agentic Enterprise)

- **Description**: Full teams of specialized agents working collaboratively. A primary (orchestrator) agent intelligently routes tasks to specialist subagents, maintains context across interactions, and coordinates complex, dynamic outcomes—potentially including external Agent2Agent (A2A) interactions.
- **Key Agentforce Features**: Advanced multi-agent patterns in Agentforce Studio, robust Agentforce Script libraries, comprehensive observability and tracing, enterprise governance at scale.
- **Business Value**: Transforms operations into a true digital labor force. Achieves compounding ROI through 24/7 autonomous execution, hyper-personalization, and innovation at scale.
- **Typical Use Cases**: End-to-end customer journey orchestration, complex operations (e.g., supply chain exception handling), enterprise-wide digital workforce supporting multiple lines of business.

Mapping the Agent Factory to the Maturity Model

Your **Agent Factory** serves as the engine that accelerates progression through these levels:

- **Levels 0–1**: Focus on foundational setup (Data Cloud indexing, basic topics/actions, templates). The Factory emphasizes reusable instructions and quick conversational builds in Agentforce Studio.
- **Levels 2–3**: Introduce Agentforce Script for deterministic control, modular subagents, and integration with Flows/Apex/MuleSoft. The Factory standardizes production through script libraries and testing automation.

- **Level 4**: Fully leverages multi-agent orchestration, primary-agent routing, and continuous improvement via observability. The Factory becomes a governed production line with version control, batch testing, and reuse at enterprise scale.

Agent Factory Capabilities by Maturity Level

Maturity Level	Agent Factory Focus	Key Enablers in Agentforce
0–1	Rapid prototyping & grounding	Templates, Topics, Knowledge, basic Builder
2	Action orchestration & scripting	Actions, Agentforce Script basics, single-domain testing
3	Cross-domain complexity	Advanced Script, multi-domain actions, hybrid reasoning
4	Industrialized multi-agent fleets	Orchestration patterns, observability, script libraries, governance

Advancing Through the Levels: Practical Guidance

1. **Assess Your Current State** — Use Salesforce's assessment tools or workshops to benchmark against the model. Identify quick-win use cases in Level 1–2 for early wins.
2. **Build Foundations** — Prioritize Data 360 readiness, Einstein Trust Layer configuration, and governance (permissions, audit logs).
3. **Iterate with the Agent Development Lifecycle** — Ideate → Build (conversational + Script) → Test (Planner + batch) → Deploy → Monitor & Tune.
4. **Measure Progress** — Track metrics that evolve with maturity: resolution rate and containment (early levels) → process cycle time and cost savings (mid levels) → overall digital labor utilization and business outcome impact (Level 4).
5. **Scale via the Factory** — Once at Level 2+, institutionalize reuse, modular design, and cross-team sharing to reach Level 4 efficiently.

Many organizations begin their Agentforce journey already closer to Level 1 than they realize, thanks to existing Einstein capabilities and CRM data. The Agentic Maturity Model

removes guesswork by providing a shared language and actionable steps.

Benefits of Using the Maturity Model with Your Agent Factory

- **Risk Mitigation** — Progress incrementally, proving value and refining governance at each stage.
- **Faster ROI** — Focus initial Factory output on high-impact Level 1–2 agents, then layer on complexity.
- **Organizational Alignment** — Gives business and IT a common roadmap for investment, training, and change management.
- **Future-Proofing** — Positions your enterprise for deeper integrations (e.g., with MuleSoft, external agents) as Agentforce evolves.

By aligning your Agent Factory implementation to the Agentic Maturity Model, you create a structured path from pilot success to transformative digital labor—delivering reliable, scalable, and governed agentic capabilities that drive competitive advantage.

This addition keeps the white paper cohesive and actionable. Let me know if you'd like me to expand it with more examples, integrate it fully into a revised full document, add visuals (e.g., a maturity ladder diagram description), or adjust the depth for a specific audience (e.g., technical architects vs. executives).
