Marketing Cloud on Core — Feature by Feature overview

Marketing Cloud on Core — feature by feature

A structured walkthrough of every major capability across Marketing Cloud Growth and Advanced editions, powered by Data Cloud and Salesforce core.

Growth · Advanced · Add-on

Platform foundation

Growth ▼

Built on Salesforce core
Shares the same architecture, UI patterns, and data layer as Sales, Service, and other Salesforce clouds — no separate login or data silo.
Growth

Data Cloud integration
Marketing Cloud on Core sits directly on Data Cloud, using it as the single source of truth for customer profiles, segmentation, and activation.
Growth

Unified individuals
Identity resolution merges leads, contacts, and records from multiple systems into one reconciled profile per person. Marketers segment and personalise from this single profile.
Growth

Consumption-based pricing
Pay in Data Cloud credits for segmentation, activation, identity resolution, and sending — not flat per-seat fees. Credit usage varies by operation type.
Growth

Email

Growth ▼

Drag-and-drop email builder
Lightning-style builder with components, brand application, merge fields, subject line / preheader configuration, and mobile preview.
Growth

Brand guidelines
Centralised brand identity — colours, typography, button styles, tone — applied automatically to new emails. Updates propagate to existing branded assets on republish.
Growth

Dynamic content
Define personalisation points (subject, image, body block) with named variations and targeting rules driven by data graph attributes. Up to 25 points per email.
Growth

Cross-object merge fields
Pull data not just from the Contact but from related objects (e.g. most recent opportunity, account type) via the data graph without pushing all fields onto the Contact record.
Growth

Einstein send time optimisation
Learns each individual's historic open patterns and sends within a configurable 24-hour window at the moment they are most likely to engage.
Growth

Einstein metric guard
Filters likely bot opens and clicks from engagement metrics so STO and scoring models reflect genuine human behaviour.
Growth

SMS & WhatsApp

Add-on ▲

Outbound SMS
Send one-way promotional or transactional text messages as part of flows. Requires provisioning a short code (high-volume) or long code (conversational, ~4–6 weeks).
Add-on

WhatsApp messaging
Built-in outbound WhatsApp channel with template and session message support, personalised with unified individual data including shortened landing-page links.
Add-on

Conversational SMS
Turns one-way SMS into two-way conversations routed to an Agentforce bot or human agent in Service Cloud. STOP/opt-out keywords are handled automatically.
Advanced

Blackout windows
Block all SMS and WhatsApp sends on specified dates or time ranges at org level without pausing or editing individual flows.
Growth

Flow (journey orchestration)

Growth ▲

Segment-triggered flows
Scheduled runs over Data Cloud segments for campaigns like re-engagement, top-of-mind, or event invitations. Supports configurable republish behaviour.
Growth

Event-triggered flows
Continuously running flows fired by form submissions, email opens/clicks, WhatsApp subscriptions, or custom Data Cloud real-time events.
Growth

Wait elements
Pause journeys for a fixed duration (minutes to months), until a specific date/time, or until an event (e.g. link click) occurs within a timeout window.
Growth

Decision splits
Branch paths based on data graph attributes, engagement, scores, campaign member status, or any Salesforce field — enabling conditional logic across the journey.
Growth

Record actions
Create, get, update, or delete records on any Salesforce object from within a flow — including deduplication by email before creating leads or contacts.
Growth

Consent management
Set contact point email consent status and communication subscription opt-in directly from flow steps, ensuring compliance before sending.
Growth

Path experiments
Define up to 10 paths per experiment, multiple experiments per flow. Test channels, content, or cadence with random audience splits. Winner selection is currently manual.
Advanced

Subflows
Embed reusable flow modules inside parent flows for consistent logic across multiple campaigns.
Growth

Forms & landing pages

Growth ▲

Form builder
Configurable drag-and-drop form designer with field mapping to Salesforce objects (Lead, Contact, Account, Task), placeholder text, validations, and brand styling.

Growth

Web embed
Embed forms on any authenticated external domain via an iframe embed code, keeping the form connected to its campaign and flow for automation.

Growth

Submission actions
Configure what happens after a form submit: show a thank-you message in place, or redirect to a URL — including a linked landing page.

Growth

Landing page builder
Full-page builder with layouts, images, headings, lists, and embedded forms. Includes SEO metadata, desktop/mobile preview, and vanity URL support (set before first publish).

Growth

🤖 AI — Agentforce & Einstein

Growth ▲

Agentforce campaign brief
Paste a campaign idea; Agentforce generates a structured brief with goals, audience, and messaging, then auto-creates a linked Campaign record.

Growth

AI content generation
Sparkle icons throughout builders let you generate or refine email copy, SMS text, landing page headlines, subject lines, and preheaders in the correct brand tone.

Growth

Einstein segment creation
Describe a segment in plain language (e.g. "US customers who haven't purchased in 365 days") and Einstein recommends fields and filters, which you can then fine-tune manually.

Growth

Prompt Builder & templates
Create field-generation prompt templates that pull CRM data, switch AI models, preview outputs, and wire results to Salesforce fields for use in emails or flows.

Growth

Engagement frequency
Classifies each contact as under-saturated, on target, almost saturated, or saturated. Exposed in the data graph for use in flow decision splits and segment filtering.

Advanced

Engagement scoring
Predicts likelihood to open, click, or stay subscribed. Assigns personas (loyalist, window shopper, selective subscriber, win-back) for smarter routing and segmentation.

Advanced

Campaign Designer (beta)
Provide a campaign brief; Einstein drafts campaign messaging and an initial Flow structure. Iteratively refine with prompts like "add A/B testing" or "send reminders to cold leads."

Advanced

Flow summarisation
Agentforce reads a completed Flow and generates a plain-English summary of its logic so marketers can validate the journey without reading every node.

Growth

📊 Data Cloud & segmentation

Growth ▲

Data streams & DMOs

Identity resolution

Ingest data from Salesforce CRM, e-commerce, ERP, S3, and files into Data Lake Objects, then map and harmonise into standardised Data Model Objects.

Growth

Match rules
Match rules (e.g. name + normalised email) and reconciliation rules (e.g. last-update wins) determine when records represent the same person and which field values win.

Growth

Calculated insights
SQL-based computed fields (e.g. average satisfaction score, lifetime value) that attach to unified individuals and become available for segmentation and personalisation.

Growth

Data graphs
"Bags of data" associated with unified individuals that expose selected related objects to email builders and Flow Builder for personalisation and decision logic.

Growth

Segment builder
Build segments of unified individuals from profile attributes, related objects, engagement, consent, or calculated insights. Reusable across Marketing Cloud, ad platforms, and Account Engagement.

Growth

CRM Analytics dashboards
Auto-generated lenses and dashboards from calculated insights (e.g. satisfaction north-star over time) embeddable on Lightning pages for business stakeholders.

Growth

🎯 Scoring & personalisation

Growth ▲

People scoring
Engagement score (interaction with marketing) and fit score (match to ideal customer profile) with configurable weighting — e.g. 50/50 or skewed toward engagement.

Growth

Account scoring (ABM)
Adds an optional intent component to people scoring. Configurable weighting across engagement, fit, and intent for account-based marketing use cases.

Growth

Cross-object personalisation
Merge fields from related objects (opportunities, accounts, reservations) into emails without duplicating data onto the Contact, powered by data graphs.

Growth

Dynamic content variations
Multiple named content variations (e.g. "Munich variation") per personalisation point, each with its own targeting rule. Points are reusable across email components to stay within the 25 limit.

Growth

📈 Reporting & analytics

Growth ▲

Marketing performance dashboard
Cross-campaign view with insights, trends, and filters — powered by Data Cloud and Tableau. Available without custom build-out.

Growth

Campaign-level insights
Per-campaign analytics tab showing email/SMS delivery, opens, clicks, conversions, and form completions directly on the campaign record.

Growth

Flow reporting (canvas)
On-canvas view of live flows shows counts per step and path statistics so you can see where contacts are sitting in a journey.

Individual engagement history
Engagement metrics, calculated insight scores, and activity timelines visible on Lead and Contact records via Data Cloud widgets and related lists.

Growth

Growth

Campaign management

Growth ▲

Centralised campaign hub

All assets, flows, forms, and pages are created and managed from a single campaign record. Guided campaign patterns (single email, series, form + page, event-driven) speed up setup.

Growth

Reusable content (CMS)

Default images, brand templates, and email/form/page components are centrally managed in Salesforce CMS for consistency across campaigns and workspaces.

Growth

Multi-brand support

Define multiple brand identities in a single org, set defaults per workspace, and auto-apply the correct branding to new assets.

Growth

Web tracking

Track website behaviour by enabling tracking in Marketing Cloud setup and placing a snippet on your site. Events flow into Data Cloud for segmentation and scoring.

Growth
